

PROGRESS REPORT

2010

National Strategic Plan for HIV/AIDS in Myanmar

Acknowledgement

Firstly, the National AIDS Programme would like to express its sincere gratitude to H.E., Minister for Health and Chairman of the National AIDS Committee for his valuable vision and overall guidance in the National response to HIV and AIDS in Myanmar. Special thanks are also shown to H.E. Dr. Win Myint and H.E. Dr. Myat Myat Ohn Khin, Deputy Ministers for Health for their support and encouragement towards implementation of HIV /AIDS prevention and care activities in the country.

Heartfelt gratitude is also expressed to Dr Tun Naing Oo, Director-General, Dr. Saw Lwin, Deputy Director-General and Dr. Win Maung, Director (Disease Control) of the Department of Health, for their continuing technical inputs and guidance in preparation of this 2010 Progress Report.

Special Appreciation is also given to Dr. San Hone, Focal person for Monitoring and Evaluation of the National AIDS Programme and the Monitoring and Evaluation Team of UNAIDS Myanmar Country office for their tireless efforts in making this Report become a reality.

The National AIDS Programme would also want to thank all the stakeholders, donors, implementing partners, all responsible officials of our programme for their various contributions in preparation of this Progress Report. Last but not the least, the members of various civil society organizations are greatly appreciated for their continued efforts towards the HIV and AIDS response in Myanmar.

Dr. Khin Ohnmar San
Deputy Director/Programme Manager
National AIDS Programme
Department of Health

INTRODUCTION

The National Planning Frameworks on AIDS – NSP I and NSP II

The first multi-stakeholder National Strategic Plan on HIV in Myanmar was developed and launched in 2006. The NSP was jointly developed and agreed by the stakeholders. It called for a prioritisation of prevention interventions to address the concentrated nature of the epidemic. Explicitly, the NSP recognised the need to initiate and scale up prevention efforts for men who have sex with men and injecting drug users. It also called for a further increase in programmes providing services to sex workers. Prevention interventions for other sub-population groups were also included, but they were expected to be increasingly targeted towards risk behaviour rather than population groups.

The NSP also included a rapid and substantial scale up in the provision of ARV treatment.

The Operational Plans of the NSP covered firstly 2006-2008 and the 2008-2010. Both served in conjunction with the priorities of the NSP to guide investments, such as the 3 Diseases Funds and the Global Fund¹.

The NSP through the indicators and targets set in the Operational Plan finally also provided the monitoring framework. An annual Progress Report was produced as of 2006 with an increasingly rich set of data against these indicators.

This final report of the progress of the NSP I aims at giving an overview of the achievements made in these 5 years. The NSP II has been built on the successful and proven elements of the NSP I. This report tries to highlight these successes as much as the work that still needs to be done in order to reduce new infections further and to ensure that all the people in need of treatment receive ARVs.

Looking back – What has worked

Coordination and leadership

The coordination of the HIV response has substantially improved during the period of the NSP I. Under the leadership of the Ministry of Health, the Technical and Strategy Group and its Working Groups have made substantial contributions towards the implementation of the NSP I as well as the formulation of the NSP II. These fora have fostered the mutual understanding and agreement on the course of action to take in the HIV response.

Sharing the tasks

The 5 years of the implementation of the NSP have demonstrated that targeted prevention programmes can go to scale with relatively modest investments. The mix of public and non-governmental service provision has proven to be essential to achieve the coverage notably of marginalised populations who are most at risk of HIV transmission. The decreasing prevalence among sex workers, men who have sex with men and pregnant women support the view that new infections are decreasing substantially in the key affected populations.

The substantial increase of ART provision relied on both public sector as well as non-governmental organisations. While the treatment was initially mainly in the hands of non-governmental service providers, this has changed in the last 2 years with the government taking an increasing share of the burden. The collaboration of the public and not-for profit organisations providing treatment services have shown a promising third approach to scaling up ARV treatment.

¹ Strictly speaking the implementation of the Global Fund Round 9 commenced on 1st January 2011 and thus fell into the second NSP. However, the NSP I served to develop the application to the GF with regards to prioritizing, target setting as well as costing.

Looking ahead – What still remains to be done

Prevention – prevention – prevention

Epidemiological models suggest that the HIV incidence has been falling since 2000. However, the models also indicate that every year still several thousands of people get infected with HIV. In order to further reduce incidence a continuing effort needs to be made to increase targeted prevention interventions. The most cost effective ways of delivering these services need to be identified and promoted. Prioritisation of prevention remains equally important. The success in sex workers and clients needs to be sustained. Men who have sex with men and injecting drug user programmes need to be substantially increased. This will demand for more sites and new innovative approaches notably in the provision of needles and syringes and drug dependency treatment.

Treat all the people in need

While the scale up of treatment has been impressive, this was only the beginning. Several thousand people still die every year of AIDS related illnesses. The treatment coverage in Myanmar remains one of the lowest in the world. However, it may prove challenging to mobilise funds to the levels required in the face of competing priorities in the development of the country and the global financial situation. It is therefore necessary to seek efficiencies by reducing costs and rationalising treatment approaches.

Civil society

Including people affected and infected by HIV pays off. There is a need to harness the efficiency of community based organisation and groups of people infected or affected by HIV. Many self-help groups have formed and blossomed in the last 5 years. They need to be supported and encouraged.

Legal and policy framework

HIV can be seen and treated as a public health issue. However, this does not take account of the legal and political constraints that still exist in many countries. Effective prevention efforts require eventually coherent legal and policy frameworks that work for and not against the individuals most at risk of HIV prevention.

Health systems strengthening

The health system needs to be systematically strengthened. While this effort will go beyond the immediate remit of HIV services, but there is certainly a substantial role to be played by HIV programmes and service providers.

OVERVIEW OF STRATEGIC DIRECTIONS

Table 1: Priority setting of the National Strategic Plan on AIDS Myanmar 2006-2010

Priority	Strategic Directions
Highest priority	1. Reducing HIV-related risk, vulnerability and impact among <i>sex workers and their clients</i>
	2. Reducing HIV-related risk, vulnerability and impact among <i>men who have sex with men</i>
	3. Reducing HIV-related risk, vulnerability and impact among <i>drug users</i>
	4. Reducing HIV-related risk, vulnerability and impact among <i>partners and families of people living with HIV</i>
High priority	5. Reducing HIV-related risk, vulnerability and impact among <i>institutionalized populations</i>
	6. Reducing HIV-related risk, vulnerability and impact among <i>mobile populations</i>
	7. Reducing HIV-related risk, vulnerability and impact among <i>uniformed services personnel</i>
	8. Reducing HIV-related risk, vulnerability and impact among <i>young people</i>
Priority	9. Enhancing prevention, care, treatment and support in the <i>workplace</i>
	10. Enhancing HIV prevention among <i>men and women of reproductive age</i>
Fundamental overarching issues	11. Meeting the needs of people living with HIV for <i>comprehensive care, support and treatment</i>
	12. Enhancing the capacity of <i>health systems, coordination and capacity of local NGOs and community based organizations</i>
	13. <i>Monitoring and Evaluating</i>

RESOURCE NEEDS AND AVAILABILITY

Overview 2006-2010

There has been only a modest increase in overall resources available to HIV during the first NSP. However, resources were increasingly allocated on the highest priority areas of the NSP for targeted prevention and the scale up of ARV. There are indications that the scale up has produced economies of scales which in turn show as reduced unit costs.

The NSP was never fully funded. This can be partly attributed to the lack of funding resources. The review of the NSP also revealed that some unit costs had been overestimated or fallen. Likewise, some targets notably in prevention strategies were set unrealistically high resulting in higher than realistic or necessary cost estimates.

Way forward

- Increase government contributions
- Mobilise resources for proven, cost-effective interventions
- Review costing assumptions and expenditures on a yearly basis in order to maintain a realistic national resource estimate

Government allocation to HIV

The Government total expenditure was estimated at Myanmar Kyats 1.604 billion for 2008 (UNGASS 2010). This corresponded to about \$1.52 million during that year and included costs for preventive and treatment services.

External Resources

The gap between the actual resources and the resources planned in the national strategic plan continued to grow. It was recognised that this was also partly due to setting over ambitious targets for a number of areas. This has been corrected in the new NSP.

Figure 1: Resource needs as per Operational Plan and actual resources 2006 - 2010

Figure 2 shows the allocation of external resources in millions of US Dollars. The amounts remained largely the same over the years. Some the differences over the years could be explained by reporting errors. 2010 shows a considerable increase of the amount allocated for treatment, care and support. The figures for the number of people on ARV treatment support this.

Figure 2: External resources per area of intervention as available in US\$ millions 2007 - 2010

Figure 3 breaks down the allocations for the four major pillars of the NSP as percentage. The increasing percentage allocated to treatment, care and support is reflected in greatly increased number of people on treatment.

These trends need to be carefully followed. It is a natural effect of scaling up treatment programmes that an increasing proportion of the total resources are allocated for treatment. However, this should not result in reduction of absolute amounts allocated to prevention programmes as has occurred in 2010.

Figure 3: Allocated resources – distribution by area of intervention 2007 - 2010

The majority of prevention resources were allocated to highest priority areas. However, the lower priority areas still received about \$4 million or 30% of the total prevention resources. The new strategic plan addresses some of this by providing clearer guidance on how to target clients of sex workers and regular sexual partners of key populations at risk.

Figure 4: Planned and allocated resources for prevention interventions -2010

In 2010, the emphasis on the scale up of ARV resulted in the relatively high allocation towards care, treatment and support. The other sub-components received a relatively small proportion of the resources planned in the operational plan.

Figure 5: Planned and allocated resources for care, treatment and support

The total expenditures for health systems strengthening, leadership, strategic information and M&E amounted to \$4.3 million or nearly about 90% of the resources planned in the operational plan. While this could be seen as a success, it needs to be noted that the total amount planned was very low. This is mainly explained by the difficulty to attract donors' support to support government structures, notably infrastructure and equipment. Likewise, the support to civil society is constrained by a number of factors.

Figure 6: Planned and allocated resources for health systems strengthening and leadership, SI, M&E

Figure 7: New infections by risk group and resource allocated to the risk group

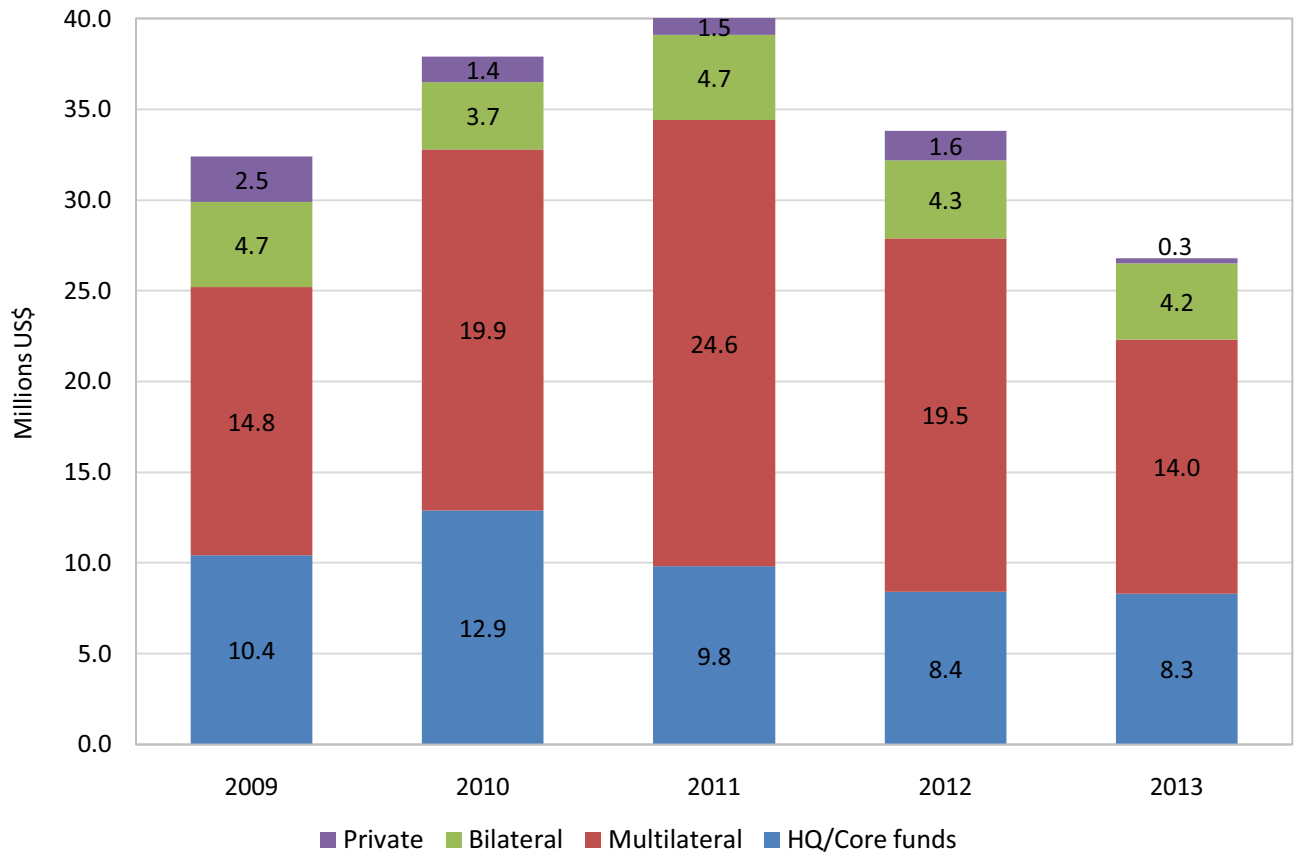

Figure 8 shows that the funding situation remains uncertain and short-termed. The Round 9 of the GFATM helped to push the level of available funding to the highest levels yet for 2010 and 2011. As of 2012, the organisations reporting anticipated or secured funding reduces greatly. Notably the uncertainty around the future directions of the 3 Diseases Fund raise concern. The scale seen in 2010 and 2011 can only be sustained if the investment in HIV programmes is sustained.

Figure 8: Distribution of source of funding from the available funding 2009 -2013

Source of funding	2009	2010	2011	2012	2013
HQ/Core funds	10,432,450	12,904,177	9,766,119	8,380,750	8,281,500

Partners working with sex workers:

AHRN, Alliance, AMI, AZG, CARE, FXB, IOM, Malteser, MANA, MDM, MBCA, MRCS, MSI, NAP, PGK, PSI, UNFPA, WHO, WV

Highlights 2006-2010

The implementation of the NSP commenced without behavioural data of sex workers and their clients. The prevalence was high at 33% in 2006. In 2007, the HSS protocol was improved and the following years measured a considerably lower prevalence of 16%, 18% and 11% for 2007, 2008 and 2009. A BSS conducted in 2007 suggested that at least knowledge among sex workers was very high as well as reported condom use with the last client (over 90%). While research with clients indicates that this may be over reporting and consistent condom use may be considerably lower, there is a strong indication that condom use in sex work has reached levels that reduce incidence.

While sex worker programmes have grown substantially in existing sites as well as through expansion to new sites, programmes for clients of sex workers were few and small in scale. Most programmes continued to target male occupational groups. The prevalence of clients is estimated through surveilling male clients with STIs. This prevalence has been more or less stable which raises concern and some questions. The sampling may need to be reviewed to ensure that it is fairly representing the clients of sex workers.

Way forward

- Sex worker programmes need to be expanded to the maximum coverage to control one of the most important vectors in the HIV epidemic
- Overlap needs to be minimised through better coordination, information sharing and programme planning

- Clients and intimate partners of clients as well as sex workers will need to be covered with specific targeted programmes
- Behavioural and biological data on sex workers and clients need to be improved to reliably assess the impact of programmes

Resources

Table 2: Planned and estimated actual unit costs for comprehensive prevention package – sex workers

Resources planned in Operational Plan 2010	Unit cost per sex worker reached Operational Plan 2010	Resources available 2010	Unit cost per sex worker reached
3,487,055	56.72	3,826,164	47.12

The total resources allocated to sex workers programmes exceeded the amount planned for in the Operational Plan by about 10%. The unit costs per sex worker were about 20% lower than the figures used for planning purposes.

The unit costs of different service providers varied greatly. The lowest unit cost was \$16 per sex worker, while the highest unit costs were over \$300 per sex worker. The highest unit costs came from non-specialised providers with a relatively small sex worker component. The integrated nature of these programmes may have caused some difficulties to extract the costs for sex worker interventions from their budgets. However, it may also be that smaller organisations struggle to provide cost effective services.

Reach

The number of sex workers reached with prevention activities continued to increase compared to previous reporting periods. The total number of sex workers reached by all organisations in all townships was reported as 81,185. This figure is likely to include overlaps between organisations operating in the same locations. It was also reported that sex workers remained highly mobile and that they change establishments on a regular basis. The degree of mobility is however not exactly known.

In order to address some of these issues a second calculation was made. For this, in each township only one organisation was counted. The cumulative figures for all townships gave an estimate of 45,489 individual sex workers reached with prevention programmes. This lower figure may still include double-counts due to migration.

The majority of services to sex workers continue to be provided by a few large organisations with multiple sites. The smaller providers operated fewer sites or had other core business with sex workers constituting only a small part of their overall programme.

Table 3: Sex workers reached by organization in 2010

Organization	2010
AHRN	358
Alliance	2,325
AMI	795

(2) HSS, 2009

(3) NAP, Progress Report 2006

(4) NAP, Progress Report 2008

Partners working with men who have sex with men:

AFXB, Alliance, AMI, AZG, CARE, IOM, MANA, MDM, MNA, MRCS, MSI, NAP, PACT, PGK, PSI, UNDP, WV

Highlights 2006-2010

The men who have sex with men population was not included in the surveillance at the outset of the NSP. Planning for services was based on the assumption that prevalence was high. This was confirmed by the first HSS in 2007 when a shocking 29% of men tested were found HIV positive. The result in 2008 was equally high with 28%. In 2009 and 2010, the prevalence was measured at 22% and 11%. While the last figure will need to be taken with caution and could be related to the sampling, the results (in combination with the number of people reached) would indicate first impacts of prevention programmes.

Way forward

- Men who have sex with men programmes reach mainly the openly gay part of this sub-population. There is a need to know more about the hidden population who often may be married and to provide prevention services to them.
- Men who sex with men have started organising in networks, based on the informal groups that existed already. This provides an opportunity to involve men who sex with men in designing and implementing their own programmes.
- Stigma and discrimination of men who have sex with men is reportedly still high and notably appears to affect their desire to access public health facilities. Reducing discrimination of public health services and increasing the choice of client friendly services will both need to be pursued.

Resources

Table 4: Planned and estimated unit costs for comprehensive prevention package – MSM

Resources planned in Operational Plan 2010	Unit cost per men who have sex with men reached Operational Plan 2010	Resources available 2010	Unit cost per men who have sex with men reached
2,941,166	51.55	1,938,784	24.9

The allocations to men who have sex with men programmes were substantially lower than the planned amounts. The available resources fell 40% short of the resources planned in the Operational Plan. The unit costs were also substantially lower than estimated in the plan. They amounted to only 40% of the budgeted amount (\$20.9 versus \$51.55). The unit costs of different organizations ranged from \$19 to \$70, with one outlier at \$261. The variance was still substantial and a review of the package of services and the costs will need to be undertaken.

Reach

The number of men who have sex with men reached with prevention activities remained nearly the same as in the last reporting period. The total number of men who have sex with men reached by all organisation in all townships was 79,522. Since several organisations provide services in the same township, it is likely that multiple-counting of men who sex with men occurred with a resulting overestimate.

In order to avoid double-counting where more than one service provided existed in a township, a second calculation was made. In each township only one service provider was counted. The total of this calculation amounted to 54,863 men who have sex with men reached.

Figure 11 shows the scale up of prevention services available for men who have sex with men. At the end of 2006, most services were located in Yangon and Mandalay. By the end of 2010, expansion had occurred these two regions, but also in other states and regions, notably Ayeyarwaddy and Bago.

Partners working with drug users:

AHRN, AZG, Burnet Institute, CARE, CCDAC, Drug Treatment Centers, NAP, MANA, MBCA, MDM, MSI, UNODC, WHO

Highlights 2006-2010

The NSP clearly highlighted the need to accelerate the roll out of prevention programmes for injecting drug users. The prevalence of people who inject drugs has remained high throughout the NSP period. In 2010, the prevalence was measured at 28%. This is lower than any year with the exception of 2002 which may have just been an outlier. However, the prevalence remains unacceptably high and in some sites was still more than 50%. BSS and HSS data showed that the situation of PWID is substantially different depending on the geographical location. This does render programming more challenging, since established programmes may not just be replicated in new areas.

Despite these challenges, increasing number of PWIDs have been accessed services since 2006 with a range of services. In 2005, just over 1 million needles were distributed free of charge. In 2010, this number had risen to nearly 7 million. The methadone programme started in 2006, but progress has been relatively slow with 1,101 active patients by the end of 2010. Many more people need to be enrolled to achieve an impact on new infections. Methadone maintenance therapy can also be an important stepping stone towards ARV treatment.

Way forward

- Scaling up programmes to the point where substantial impact on the reduction of new infections is achieved
- Address knowledge gaps to better understand the poly-drug use, links between sex work and drug, on-set of injecting
- Adapt the methadone programme to attract more patients by suppressing the induction period, increase the number of distribution points to reduce daily travel time

Resources

Over \$3.3 million expenditures were reported by harm reduction programmes in 2010. The total expenditures corresponded to only 32% of the total planned amount.

Table 6: Planned and estimated actual unit costs for comprehensive prevention package – PWIDs

Resources planned in Operational Plan 2010	Unit cost per injecting drug user reached Operational Plan 2010	Resources available 2010	Unit cost per injecting drug user and drug user reached in drop-in centre
10,726,903	254	3,353,639	153

The unit costs for per injecting drug user reached in a drop in centre was \$250, a considerable drop from last years \$314. This is partly explained by the fact that some organisations reporting expenditures for drug user programmes do not aim to provide a full set of services. This renders the unit costs of these programmes considerably cheaper. The Operational Plan used a unit cost of \$254 for each injecting drug user reached.

Reach

Harm reduction programmes have continued to extend their reach in 2010. The number of injecting drug users reached in drop-in centres was reported as 13,368, an increase of 40% from 2009.

Table 7: Drug users and PWIDs contacted

	Drug users		PWIDs	
	Total	Female %	Total	Female %
Outreach (contacts)	20,303	28%	36,814	9%
Drop-in-Centres (individuals)	8,520	9%	13,368	4%

In 2010 nearly 7 million needles and syringes were distributed. This corresponds to a 30% increase from 2009. 75% of the needles and syringes were distributed in Kachin state suggesting that the local conditions are particularly suited for larger scale needles and syringes programmes.

The needle and syringe distribution has grown twelve fold since 2004, when only 545,000 needles and syringes were distributed. In 2010 the HIV prevalence of PWIDs was measured at less than 30%. If confirmed by the 2011 HIV surveillance, this would suggest that the prevention efforts started showing some results. However, the prevalence remains unacceptably high and coverage of harm reduction services are less than needed.

Table 8: Needles and syringes distributed by organization and state/division

Figure 12: Needles and syringes distributed 2003 - 2010

Map 4: Distribution of DIC by township

The number of people on methadone maintenance therapy (MMT) has continued to grow and reach 1,121 clients at the end of 2010. However, the 2010 target of 3,000 people on MMT was widely missed. Methadone is being provided in only 10 sites – Yangon, Mandalay, Lashio, Mytkyina, Mogaung, Bamaw, Muse, Tachileik. There is need to increase the number of sites, and adapt the entry procedures and dispensing modalities in order to scale up the MMT provision more substantially.

Figure 13: People on MMT 2006 - 2010

Map 5: People on MMT and distribution of MMT sites by township

STRATEGIC DIRECTION 4: PEOPLE LIVING WITH HIV, THEIR PARTNERS AND FAMILIES

PLHIV involved in self-help groups	242,000	(1)		11,792

Source: Operational Plan M&E table

(1) NAP, Progress report 2008

Partners working with self help groups:

Alliance, AHRN, AZG, BI, CARE, FXB, IOM, MDM, MNMA, MRCS, MPG,WV, PGK, NAP, UNDP, UNODC

Highlights 2006-2010

This strategic direction should have operationalised the prevention needs of people known to be living with HIV and their intimate partners. This has never been done and instead the degree of organisation of people with HIV was reported here. The counselling and testing of the PMCT programme identified nearly 3,000 pregnant and HIV positive women in 2010. In addition, over 400 women already on ART were reported to have given birth in the same year.

Way forward

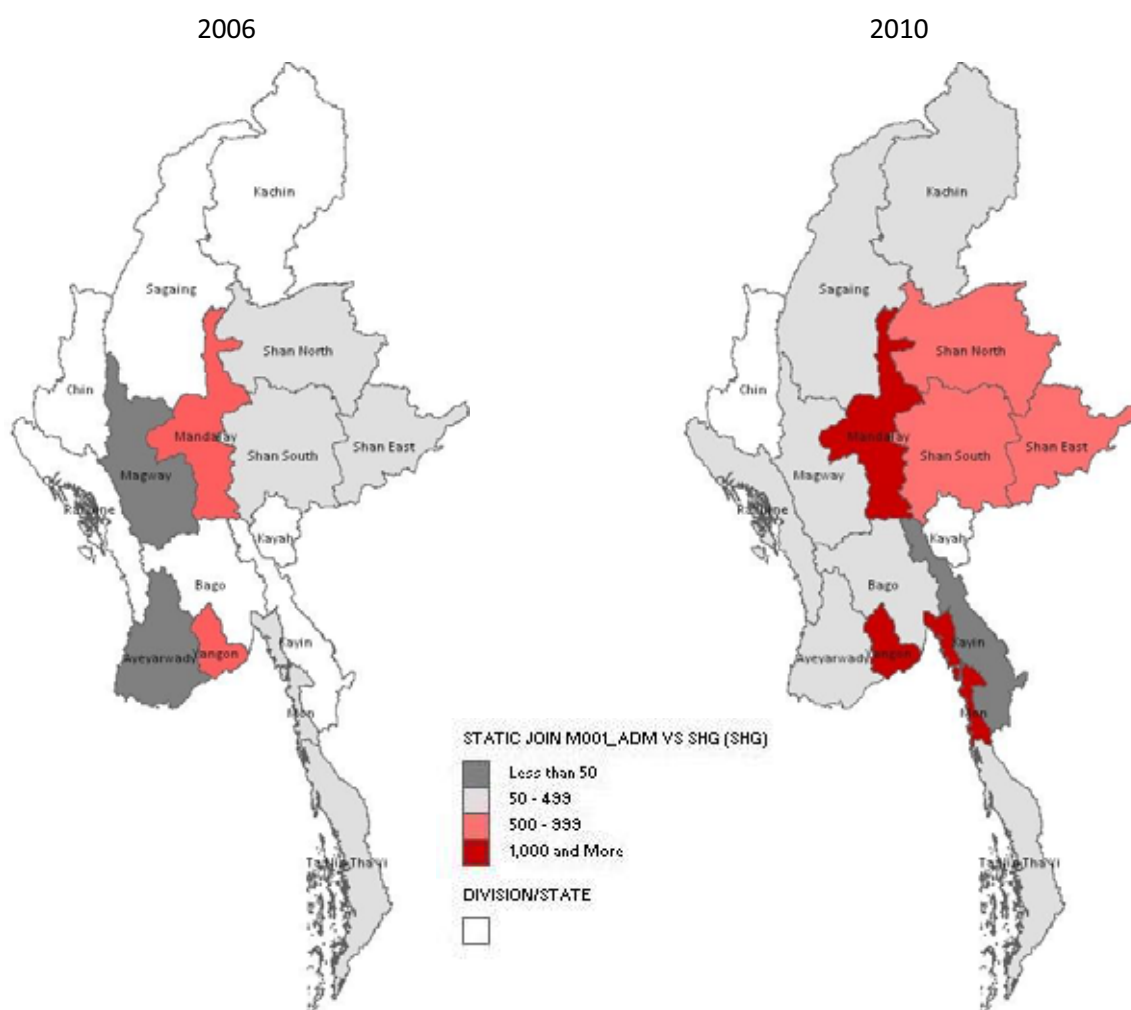

- This strategic direction does no longer exist in the new NSP. Positive prevention issues will need to be addressed through prevention activities with partners of key affected populations at risk, i.e. sex workers, men who have sex with men, PWIDs and clients of sex workers.
- The development of national networks and community based groups, including self-help-groups will have to be included in all capacity building plans and specific community capacity building plans should be developed

Reach

Map 6: Distribution by State/Divisions of self- help groups networks

The Myanmar Positive Group (MPG) traces its origins to the 2005 founding of the GIPA Project Initiative Group (GPIG). The MPG has the goal “to promote the greater and meaningful involvement of people living with HIV in the HIV/AIDS response in Myanmar”. The MPG tries to reach this through building the skills of members, reducing stigma and discrimination, promoting networking and advocating for the rights of access to treatment and services.

The growth of self-help groups and networks has been substantial. In 2005, a total of 43 self-help groups of people living with HIV were recorded as active. In 2010, this number had grown to just under 200. As can be seen in the map below, there were more states and regions with self-help groups in 2010 than in 2006. Equally, all states and regions had higher numbers of members.

As far as HIV related networks are concerned, none existed in 2005, while by 2010 there existed 7 networks covering men who have sex with men, PWIDs, women, sex workers, Myanmar Interfaith Network on AIDS, 3N (NGOs and community based organisations), and MPG.

MPG has been increasingly able to provide self-selected representatives to coordination mechanisms and other networking initiatives. These include the Myanmar Country Coordinating Mechanism (M-CCM), the Technical and Strategy Group (TSG) for AIDS, the Private Partnership for Public Health (PPPH), the National NGO Network (3N), as well as the Asia Pacific Network of People Living with HIV (APN+). The participation of self-selected members of people living with HIV has been a significant event in the development of the coordination mechanisms for HIV in Myanmar.

In early 2011, the MPG carried out an assessment its affiliated groups. The assessment took stock of number of groups, its memberships as well as the activities that are carried out. It provides as with the most accurate count of self-help groups so far. Only active members were counted and as a result, the numbers were slightly lower than in previous years.

The self-help groups stated that they were involved in a number of different activities. Most of the groups carried out multiple activities.

Table 10: Self-help groups involved in different activities (Multiple responses allowed)

Activities	Number of groups involved
Prevention	176
Treatment	110
Care and support	175
Social support	163
Other support	90
Income generation activities	140

STRATEGIC DIRECTION 5: INSTITUTIONALIZED POPULATION

Output/Coverage Targets	Size estimate	Baseline 2006	Target 2010	Results 2010
Prisoners reached by health education	62,300 ⁽¹⁾	2,604 ⁽²⁾	22,000	9,486

Source: Operational Plan M&E table

(1) Statistical Yearbook 2001

(2) NAP Progress Report 2006

Partners working with institutionalized population:

AHRN, CARE, MANA, NAP

Highlights 2006-2010

During the implementation of the NSP I access to institutionalised populations has been limited in scope with the NAP delivering the majority of services. However, these activities were insufficiently resourced and did not cover the full range of services that international good practice recommends.

Way forward

- Renew the dialogue with the Prison Department to seek a way forward with health education, primary health care and HIV prevention for prisoners

Resources

No expenditures were reported under this heading for 2010. This is likely that this is due to budgeting issues, since several organisations reported prevention activities.

Table 11: Planned and estimated actual unit costs for comprehensive prevention package – institutionalized population

Resources planned in Operational Plan 2010	Unit cost per institutionalized person reached Operational Plan 2010	Resources available 2010	Unit cost per institutionalized person reached
197,313	8.97	-	-

Reach

The reach of prisoners with HIV prevention activities remains low and limited in scope of services available.

Table 12: Institutionalized population reached by organization

Organization	2010	
	Male	Female
AHRN	250	10
CARE	98	131
MANA	845	602
NAP	4,109	3,441
Total	5,302	4,184

STRATEGIC DIRECTION 6: MOBILE POPULATION

Output/Coverage Targets	Size estimate	Baseline 2006	Target 2010	Results 2010
Mobile and migrant population reached by package of prevention programme		427,717 ⁽¹⁾	400,000	54,613

Source: Operational Plan M&E table

(1) NAP Progress Report 2006

Partners working with mobile population:

AMI, AZG, CARE, FXB, IOM, Malteser, MANA, MBCA, MRCS, NAP, PGK, UNODC

Highlights 2006-2010

Programmes for mobile populations have attracted much less funding than planned for in the Operational Plan and as a result the targets were substantially underachieved in every year. It appears that some organisations also shifted their reporting from mobile populations to workplace or general populations.

Thus, it is difficult to establish trends and geographical coverage. The mobility specific risks have not been researched which renders targeted programming and monitoring difficult.

Way forward

- Research the mobility related risks in HIV transmission
- Identify cost-effective interventions that can be taken to scale

Resources

Only half of the organisations reporting prevention activities for migrant population also reported expenditures for mobile population. It is therefore not possible to establish unit costs.

Table 13: Planned and estimated actual unit costs for comprehensive prevention package- mobile population

Resources planned in Operational Plan 2010	Unit cost per mobile population reached Operational Plan 2010	Resources available 2010	Unit cost per mobile population reached
4,414,173	10.99	389,232	7.12

Reach

As in previous years, the majority of people reached with prevention activities are male. The total number of people reached has further decreased.

Table 14: Mobile population reached by organization

Organization	Male	Female	2010

STRATEGIC DIRECTION 7: UNIFORMED SERVICES

Output/Coverage Targets	Size estimate	Baseline 2006	Target 2010	Results 2010
Uniformed personnel reached by package of prevention programme		14,909 ⁽¹⁾	100,000	11,962

Source: Operational Plan M&E table
NAP Progress Report 2006

Partners working with uniformed services:
AMI, AZG, CARE, FXB, Malteser, MANA, NAP, UNODC

Highlights 2006-2010

New military recruits have been part of the yearly surveillance system since 1992. However, there is little other data on available on HIV in uniformed services. The surveillance has not been linked to programmes, but has rather served as a proxy measure for young men. The Defence Medical Services have published some research that shows HIV and AIDS are known and recognised in the defence forces. There is no indication that comprehensive prevention programmes have been implemented.

Way forward

- Identify programme interventions that can be rolled out in the defence services and the police as first priorities
- Explore behavioural risks among uniformed service personnel and the use of peers to roll out prevention activities

Resources

The resources reported to be spent for uniformed services were very low. The calculated unit costs were also very low. However, there is some doubt whether a valid analysis can be carried out with such a low level of funding and reach.

Table 16: Planned and estimated actual unit costs for comprehensive prevention package – uniformed services

Resources planned in Operational Plan 2010	Unit cost per uniformed person reached Operational Plan 2010	Resources available 2010	Unit cost per uniformed person reached
911,122	9.11	37,542	3.1

Reach

The National AIDS Programme delivered more than 70% of the services, a further increase over previous years. Nevertheless, some non-governmental service providers continue to provide small scale prevention interventions. While the size of these programmes is small, it is important that opportunities to engage with uniformed services were used.

Table 17: Uniformed services personnel reached by organization

Organization	AMI	AZG	CARE	FXB	Malteser	MANA	NAP	UNODC	Total
Male	75	33	29	927	559	162	6,439	911	9,135
Female	-	-	24	290	76	71	2,366	-	2,827

STRATEGIC DIRECTION 8: YOUNG PEOPLE

Impact/Outcome Targets	Size estimate	Baseline 2006	Target 2010	Results 2010
% of young people that are HIV infected	10,648,000 ⁽¹⁾	1.29%	1.7%

(4) NAP Progress Report 2006

Partners working with young people:

CARE, DEPT, FXB, Malteser, MANA, MBCA, MRCS, MSI, NAP, PGK, SC, UNICEF, UNODC, WV

Highlights 2006-2010

Compared to the Operational Plan, the youth prevention programmes have under achieved in terms of funding as well as results. Youth programmes aimed in principal at out-of school youth and in-school youth through life skills training. The life skills training include HIV, but this represents only a small fraction of the life skills. Costing, planning and reporting under the NSP for life skills made therefore little sense and was abandoned in the new NSP.

The particular risk of out-of school youth was assessed in a behavioural sentinel survey (BSS) in 2007. In the absence of a comparative study, it is not known whether their sexual behaviour is any different from either in-school youth of the same age or other adults. The survey established however that the youth participating in the survey were sexually active, notably the male part.

Way forward

- The NSP does not include a specific youth intervention strategy. It is expected that programmes have either ensure that youth are included appropriately in the existing programme or particular programme interventions are developed where it is deemed necessary
- Improve the data collection, reporting and analysis with regard to the age of the programme beneficiaries
- Establish an early warning system that alerts on changes in the sexual behaviour of youth and the associated risk

Resources

Less than 40% of the planned resources were available for HIV preventions programmes in 2010. However, there are some difficulties to assess the level of expenditures for youth activities, since these activities are in some case implemented outside of HIV departments.

Table 18: Planned and estimated actual unit costs for prevention package – OSY

Resources planned in Operational Plan 2009	Unit cost per OSY reached Operational Plan 2010	Resources available 2010	Unit cost per OSY reached
4,327,665	7.92	1,676,349	5.2

Reach

The number of out-of-school youth reached increased in second consecutive year. Keeping in mind that the resources were less in 2010 than in previous years, this increase in numbers of people reached needs to be interpreted with caution. From the present reporting system it cannot be established what type of services are provided to the targeted youth.

(1) NAP Progress Report 2006

Partners working with workplace HIV prevention activities:
AMI, AZG, CARE, FXB, IOM, MANA, MBCA, MRCS, National AIDS Programme

Highlights 2006-2010

The targets for people reached with workplace prevention services have never been reached despite a substantial downward revision of the targets in 2008. There is little known about the risk behaviour of particular occupational groups. This renders the planning and delivery of targeted intervention services challenging. Large scale workplace programmes have not materialised and they are not prioritised in the NSP. However, it could be envisaged that the private sector engages and finances these programmes without need for external funding.

Way forward

- Seek more information about specific risks of occupation groups
- Advocate with the private sector to engage and finance workplace programmes for HIV interventions, possible within the framework of a reproductive or primary health programme
- Take advantage of opportunities to deliver services in hard to reach areas if workplace interventions appear to be best entry point

Resources

The reported amounts spent on prevention activities at the workplace was about 10% of the planned resources. This continues a trend of declining funds available for these activities.

Table 21: Planned and estimated actual unit costs for comprehensive prevention package – workplace

Resources planned in Operational Plan 2010	Unit cost per worker reached Operational Plan 2010	Resources available 2010	Unit cost per worker reached
2,634,260	8.78	253,238	4.3

Reach

In 2010 a total of 58,832 were reached by workplace prevention interventions. This constituted a slight increase over the previous years and reverses a trend of declining numbers of people reached at the workplace. The service delivery remained mainly with 3 organisations that delivered over 80% of the services.

It is noteworthy that a substantial number of people reached were located in hard to reach areas of Mandalay division.

(1) Technical report of estimation and projection workshop, 2009, Myanmar; prevalence for 15-49 years of age

(2) NAP Progress Report 2006

Highlights 2006-2010

The strategic direction for prevention activities for women and men of reproductive age was included in the NSP to accommodate some of the on-going programmes that delivered prevention messages to men and women who could not easily be placed into any of the specific strategic directions 1 to 9. It was also used to include the STI treatment and HIV counselling and testing assuming that neither one could be fully attributed to the specific key populations at risk.

The reporting under this heading proved not to be consistent and difficult to analyse. The prevention activities reached a ill defined population with an unknown risk to HIV transmission. In 2008, the possibility to report the number of clients of sex workers was introduced which addressed the above issue to a certain extent. The surveillance does not provide any measurement for the prevalence of this age group and the results need to be derived from models. HIV testing was increasingly reported under the specific risk groups, thus leading to a decline in reported numbers when HIV counselling and testing actually grew. As for STI patients, a larger number of STI treatments were reported in 2010 than in 2006 reflecting the increasing number of service providers and service delivery points. However, the fact that the majority of the STI patients are classified as 'low risk' does not improve the understanding of the sources and routes of transmission of the STIs.

The NSP II addresses these issues by distributing the risks to identified risk populations, notably clients of sex workers, and the sexual partners of key populations at risk. The reporting systems of all partners will need to be adapted accordingly.

Way forward

- Improve the reporting of STI, HIV counselling and testing regarding gender disaggregation and specific risk profiles of clients

Prevention for women and men of reproductive age

Partners working with women and men of reproductive age:

Alliance, AMI, AZG, CARE, IOM, Malteser, MANA, MRCS, MSF-CH, MSI, NAP, PSI, UNDP, UNODC

Resources

Unit costs were initially developed, but the populations reached and reported under this heading differ widely thus rendering analysis difficult.

Reach

A total of 772,769 people were reported to be reached by prevention interventions. This constitutes an increase of nearly 300,000 people reached compared to 2009. Most of the increase was attributed to the higher number of clients of sex workers reached. It appears unlikely that nearly 330,000 clients of sex workers were reached, since this would have constituted over a third of the total estimated clients of sex workers. There may be either a substantial multiple-counting or the people reached with prevention interventions are assumed to be clients. Either way, it will be important to improve the targeting and reporting of clients of sex workers.

Table 24: Women and men of reproductive age reached by prevention programme by state and division

State & Division	Male	Female	2010

Yangon	105,749	20,116	125,865
Total	541,525	231,244	772,769

The analysis of the reported figures from mobile population, youth, workplace, clients of sex workers (as of 2008) and general population of reproductive health proved difficult from the onset of the implementation of the NSP I. The numbers reported fluctuated considerably over the years. Figure 14 aggregates the yearly reported totals of all these sub-populations. This shows that these 4 areas of prevention showed a combined decrease until 2009. In 2010 this fall is reversed notably due to the increased number of reported clients of sex workers reached.

The trend seen is in line with the priorities of the NSP I. Since the highest priority prevention interventions were not fully funded, it appears normal that funding would be reduced in the prevention areas that are considered lower priority and less targeted. The NSP II addresses this issues by calling for targeted interventions for clients of the sex workers and the regular sexual partners of key populations at risk (i.e. sex workers, clients of sex workers, PWIDs, men who have sex with men). These interventions are costed and targets have been included in the operational plan. This has the advantage that interventions will be increasingly targeted towards sub-populations that are exposed to the risk of HIV transmission. Interventions that include individuals having no exposure to HIV through their own or their partners behaviour will no longer be carried out or at least reported under the NSP II.

Figure 14: Different target population reached by prevention programme 2006-2010

Table 25: Target populations reached by year 2006-2010

Target Population	2006	2007	2008	2009	2010

AHRN, Alliance, AMI, AZG, CARE, FXB, IOM, Malteser, MANA, MBCA, MDM, MNA, MRCS, MSF-CH, MSI, NAP, PACT, PGK, PSI, RM, UNION, UNODC, WV

Reach

The total number of adults who were counselled and tested for HIV in 2010 decreased slightly compared to 2009. This decrease does not concern the testing of sex workers, TB patients and men who have sex with men who have all seen increases in the numbers counselled and tested. The total numbers remain however modest and more efforts will need to be made to scale up counselling and testing.

Table 26: People receiving HIV test and post-test counselling 2006 - 2010

	2006	2007	2008	2009	2010

Treatment of sexually transmitted infections (STI)

Partners working with STI treatment provision:

Alliance, AMI, AZG, CARE, IOM, Malteser, MANA, MDM, MSF-CH, MSI, NAP, PGK, PSI, UNODC

Reach

Treatment for STI infections increased for a second consecutive year. In 2010, nearly 190,000 STI treatments were reported by 15 organisations. This represents an increase of about 40% over the previous year. A majority of treatments were reported from the private sector clinics operating under a social marketing franchise. As in previous years, multiple counting may occur in some instances since it is impossible to trace clients of STI services across different service providers.

(1) The estimated percent of HIV positive infants born to HIV positive mothers is based on the PMCT program in countries. Myanmar indicates that the PMCT program at that time of study was single dose Nevirapine, that women practise mixed feeding of infants, and that they breastfeed on average 7-17 months. Based on these practices, the estimated transmission from HIV positive mothers to their infants is 21.5%. This assumption is based on research that has been conducted in the field.

(2) HIV Estimates and Projections, Myanmar 2008-2015

(3) NAP Progress Report 2006

(4) From Spectrum – Myanmar 2009 final 7 Oct

Highlights 2006-2010

While the achievement of ARV treatment has been short of the targets of NSP I, the scale up has nevertheless been impressive. The five years from 2006 to 2010 have seen an increase of 25,000 people provided with ARV treatment. Patients continue to show up with low CD4 counts indicating that there remains substantial potential for further scaling up the treatment response. The change to an access criteria of less than 350 CD count will further enlarge the pool of potential beneficiaries of ARV treatment.

Equally the PMCT programme has seen a substantial increase in coverage during the first NSP. The number of women undergoing HIV testing as well as those who receive ART prophylaxis or ARV

treatment has more than tripled since 2006. There is some uncertainty about the resulting coverage. The total number of women needing PMCT was estimated at 3,600 in 2010. This would imply a coverage of nearly 70%. This is unlikely, with view to the fact that less than a third pregnant women are reached with the PMCT programme, i.e. pre-test counselling. The result indicate though that the targeting on urban areas enables the PMCT programme to identify a higher than average number of HIV positive pregnant women.

More and better data will be required in order to understand the impact the PMCT programme has on the number of HIV positive children. Finally, in order to further scale up efficiently, the PMCT programme will need to be integrated into the ANC and child health programmes. Those programmes will in turn need to increase their service coverage which is at only 70% for the ANC programme.

Way forward

- Impact mitigation is a major component of the NSP II and orphans and vulnerable children will be part of this component; this offers opportunities to expand programmes and to improve monitoring and reporting
- The non medical part of community home base care will be also under the heading of impact mitigation necessitating new ways of assessing and monitoring progress

Care, treatment and support – Package of support with or without ART

Partners working with care, treatment and support:

AHRN, Alliance, AMI, AZG, Burnet, CARE, Consortium, FXB, IOM, Malteser, MANA, MNMA, MRCS, MSF-CH, MSI, NAP, PACT, PGK, PSI, RM, UNODC, WHO, WVI

Resources

Over \$14 million were spent on care, treatment and support inclusive of ART. This represents a 50% increase from 2009. The unit costs per person and year was less than \$500, roughly the same as in the previous year.

Table 29: Planned and estimated actual unit costs for comprehensive package of care and support with ART

Resources planned in Operational Plan 2010	Unit cost per person Operational Plan 2010	Resources available 2010	Unit cost per person
21,180,874	526	14,796,387	496

Reach

As expected the treatment results have all show considerably growth in 2010. More than 50,000 people were reported having received Cotrimoxazole prophylaxis. While this number seems high and it is likely to represent treatment episodes rather than individuals that are on regular and medically followed prophylaxis, it indicates nevertheless that the pipeline for ARV treatment is long. Scaling up ARV treatment seems to be therefore mainly an issue of organisational capacity and available resources.

Over 8,500 additional people have started ARV in 2010. This was the highest yearly increase recorded so far in Myanmar. 44% of the patients on ARV medication were female. A total of 2,110 children are part of the people on treatment.

The geographical distribution of ARV treatment remained focused on Yangon, Kachin, Mandalay and Shan.

Nearly 90% of the ART is delivered by 4 organisations. Two of those delivered their programmes from clinics operated by NGO staff. The two others, one of them being the National Aids Programme, delivered their treatment through the public health services. At the end of 2010, the public sector cared for over 25% of the total patients.

Prevention of mother-to-child transmission of HIV (PMCT)

Partners working on PMCT:

AMI, AZG, Malteser, MSF-CH, National AIDS Programme, SC, UNFPA, UNICEF

Resources

A total of \$1.794 million were available to PMCT in 2010. This corresponds to only about a third of the resources planned for in the operational plan. Unit costs were lower than planned with less than half of the estimated need per pregnant women reached with pre-test counselling. The cost per pregnant woman who was reached amounted to \$3.33.

Table 33: Planned and estimated actual unit costs for comprehensive prevention package - PMCT

Resources planned in Operational Plan 2010	Unit cost per pregnant women reached Operational Plan 2010	Resources available 2010	Unit cost per pregnant women reached (pre-test counselling)
3,367,327	5.61	1,794,988	3.33

Reach

In 2010 a total of 2,488 mother and baby pairs received a course of ART prophylaxis, this was about 352 more than in the previous year. The public health facilities contributed 80% of the total.

Figure 18: Mothers receiving ART prophylaxis 2003 - 2010

Community home-based care

Partners working on community home-based care:

Alliance, AMI, CARE, FXB, IOM, Malteser, MBCA, MNMA, MRCS, NAP, PACT, PGK, RM, UNODC, WVI

Reach

A total of 34,713 people were reported having received some form of community home based care. This included psycho-social, food/financial as well as medical support. Not everyone received all types of support since organisation provided support as needed on a case-by-case basis.

Table 34: People receiving community based care with different type of support – by organization

Organization	Psycho-social support	Food, material, financial support	Medical support	Total	
				Male	Female
Alliance	✓	✓	✓	4,559	4,479
AMI	✓		✓	20	74
Burnet	✓	✓	✓	159	174

Orphans and vulnerable children (OVC)

Partners working with orphans and vulnerable children:
Alliance, Burnet, CARE, MRCS, NAP, PGK, RM, SC, UNDP, UNICEF, WV

Resources

Similar to previous years, the programmes for orphans and vulnerable children reported expenditures of about 20% of the total amount planned for in the Operational Plan. Unit costs were substantially lower than planned. It is not clear whether this was due to cheaper than planned services or whether the package of services was not provided to its full extent.

Table 35: Planned and estimated actual unit costs for comprehensive prevention package - orphans and vulnerable children

Resources planned in Operational Plan 2010	Unit cost per child reached Operational Plan 2010	Resources available 2010	Unit cost per child reached
4,845,174	107.67	1,156,742	69.9

Reach

A total of 16,550 were reported to have benefited from support in 2010. This constituted a 30% increase compared to 2009. The proportion of those children reported as affected by HIV were about half of all children indicating that these programmes are well targeted.

Figure 21: Orphans and vulnerable children receiving support 2005 - 2010

Map 11: Distribution by township of services for orphans and vulnerable children

STRATEGIC DIRECTION 12: ENHANCING THE CAPACITY OF THE HEALTH SYSTEM

Output/Coverage Targets	Size Estimate	Baseline 2006	Target 2010	Results 2010
% of townships implementing HIV testing with no stock-out of HIV test kits	325			0
Number of HIV testing laboratories participating in NEQAS for HIV serology				302
Proportion of transfused blood units screened for HIV in a quality assured manner ⁽¹⁾	200,000			100%
Number of Service Delivery Points offering VCCT		291 ⁽²⁾	500	470 ⁽³⁾

(1) Indicator amended to reflect UNGASS indicator

(2) NAP Progress report 2006

(3) Universal Access 2010 report (Public = 300, Private = 170)

Highlights 2006-2010

The number of service delivery points offering HIV counselling and testing expanded greatly during the 5 years of the NSP. Several organisations received permission to provide the full range of testing, including lab services. The National Health Laboratory increased its NEQAS for HIV serology by including more public as well as private laboratory facilities. In 2010, the development of national testing and counselling guidelines started with a national consultation workshop.

Way forward

- Decentralise HIV counselling and testing to include more organisations and more service delivery points
- Improve the forecasting, supply management and reporting systems for test kits
- Develop a national plan for safe blood supply which includes a forecast of national needs for blood transfusions

In 2010, national guidelines for HIV counselling and testing were developed. A national workshop was held in order to seek inputs from the wide range of stakeholders. The participants developed a number of recommendations which are included in the final draft of the guidelines. The guidelines ensure that best use is being made of rapid tests. This will lead to a decentralization of testing which will include two major aspects.

Firstly, the number of testing facilities – government as well as non-governmental - that include the entire range of counselling will need to increase. These facilities will be able to make use of the rapid tests and make test results available to clients immediately after the pre-test counselling. Secondly, more health staff will be trained to process rapid testing thus reducing the need for specialized staff and laboratory equipment.

The guidelines also call for client friendly testing facilities that are free of stigma and discrimination. This is of particular importance for marginalized groups such as people who use drugs, men who have sex with men, transgender and sex workers. Continued efforts have been made to improve the procurement and supply management system for HIV kits. No stock outs have been reported from the service delivery points.

However, there is a possibility that testing facilities reduce their level of activities when stocks get low in order to avoid complete stock outs. The reporting of test kit use in the public sector seems to have improved following the introduction of new reporting forms. The coordination of procurement of test kits remains challenging since several agencies procure test kits for different programmes on behalf of the NAP. In the case of delays, test kits are borrowed from other projects making reporting complicated.

STRATEGIC DIRECTION 13: MONITORING AND EVALUATION

Highlights 2006-2010

The first inclusive National Strategic Plan offered the opportunity to commence a national M&E system. The NSP included several important steps towards an improved understanding of the epidemic.

First, an annual Progress Report was compiled and published which included information of all HIV stakeholders against the agreed national indicators. This allowed a yearly check on the progress of the NSP. The Progress Report also included expenditure data against the 13 Strategic Directions of the NSP. This allowed the analysis of actual expenditures and unit costs.

Second, the HIV Sentinel Surveillance system was improved by adding men who have sex with men to the sentinel group, by increasing sample sized and by involving no-governmental organisations in the collection of samples, mostly through their drop-in centres.

Third, the NSP included several behavioural surveys for key affected populations which provided for the first time solid behaviour data on the sex workers, out-of-school youth, PWIDs and men who sex with men. This in turn enabled the country to engage in more advanced modelling of the epidemic, notably the Asian Epidemiological Model that offers improved forecasting of future, expected new infections.

Way forward

- Develop and implement a comprehensive research agenda that makes use of local research capacity by increasing the type and number of studies being carried out by a larger number of organisations
- Carry out evaluations for essential prevention programmes to establish a better understanding of the effectiveness of interventions
- Improve quality and timeliness of routine reporting, including the surveillance and programme reporting
- Further enhance the epidemiological models that provide essential data for decision making

National M&E System and National M&E Plan

In conjunction with the preparation for the implementation of the Round 9 of the GFATM, a Monitoring and Evaluation System Strengthening (MESS) Workshop was held with participants from government, civil society and UN agencies. The findings and recommendations of this workshop concern three major areas. First, there was a commitment to develop a comprehensive national M&E plan. A Strategic Information and M&E Working Group was subsequently formed under the TSG and tasked with the development of the plan. The Working Group has started the work on indicator definitions and the research agenda. Second, there was a recommendation to improve the routine monitoring system. The NAP reviewed all its reporting forms and aligned the reporting on prevention activities to the national indicators and the GF. A round of assessment visits revealed the challenges in the reporting and trainings were held to address these issues to staff of the STD Teams.

Strategic Planning and the Use of Estimations for Planning

In 2010, a new National Strategic Plan was developed for the years 2011-2015. In order to inform the planning process, a temporary Working Group was formed with the task to gain a better understanding of the epidemic. The Working Group used two epidemiological models. The first model used was the Modes of Transmission models. This is a Excel spreadsheet based model that can calculate the estimated incidence in a year broken down by sub-groups. The second model explored was the Asian Epidemic Model (AEM) that can

project incidence over time. The AEM is more data intensive, because it takes behavioral data into consideration when calculation future expected infections (i.e. high condom use leads to fewer infections).

The Working Group met several time in the course of 2010. The members of the Working Group looked at all available data which included surveillance, monitoring and service statistics from government and non-governmental service providers. The data was used to triangulate and to decide on the most likely data.

Once the Working Group agreed on the data to be used, the models were established and compared. It was found that the AEM was best suited for the use in the national planning process, because of its capacity to project new infections for several years ahead.

Table 36: Selected results from EPP/Spectrum and AEM (draft) 2010²

	EPP/Spectrum	AEM
People living with HIV (15+)		
Total	230,800	225,223
Males	149,553	148,755
Females	81,247	76,768
New infections		
Total	16,303	9,606
Males	10,162	5,857
Females	6,141	3,749
Death due to AIDS		
Total	16,083	21,841
Males	11,291	15,586
Females	4,792	6,255

The table above shows that the results for EPP/Spectrum and AEM show similar estimates for the number of adults living with HIV. However, the numbers of estimated number of new infections and number of deaths due to AIDS related illnesses differ substantially. The AEM has lower estimated numbers of new infections and higher number of deaths. As a result, the projection over several years will show lower numbers of people living with HIV in AEM. The lower number of new infections can be explained by the fact that the AEM takes behaviours into account in its calculations. The behavioural surveys done for sex workers indicate a relatively high condom use which would in turn reduce the new infections for clients, the regular partners of clients and sex workers themselves. The same applies, to a lesser degree to men who have sex with men.

HIV sentinel surveillance (HSS)

The National AIDS Programme carries out the HSS on a yearly basis during March to May in 34 townships where AIDS/STD teams are located. Target groups included are pregnant women attending ANC clinics, male STI patients, new TB patients, female sex workers, PWIDs, men who have sex with men, new military recruits and blood donor units. For female sex workers and men who have sex with men, non-governmental organisations with drop-in centres are asked to provide blood samples from their sites.

HIV prevalence continues to be the highest among PWIDs. However it has been assessed at well below 30% which is considerably lower than in 2009. The prevalence of female sex workers has been for second consecutive time measured at just above 10%. The prevalence of the men who have sex with men shows the biggest decrease. In 2010 it was just half of what it was in 2009. This last drop is unlikely to be explained by the impact of prevention programmes or deaths.

² Spectrum file: Myanmar 2009 Final 7 Oct; AEM file: AEM Analysis Myanmar with all intervention 2 Dec (data taken from baseline)

The prevalence for pregnant women was measured as 0.9%, marginally lower than last year. The prevalence of male STI clients on the other hand remains at 5.1%. This is slightly higher than the result of 2009 when prevalence was 4.85%. This sentinel group is used as a proxy for clients of sex workers. There is some concern that the prevalence in this group has remained roughly stable. It will be crucial to find out why this is so, since this group is a major source of new infections among their regular sexual partners.

The table below shows the HIV prevalence across the sentinel groups.

Table 37: HIV prevalence among sentinel populations – HSS 2010

Sentinel groups	HIV prevalence					# of HIV tested (n)	#of HIV positive (n)
	% HIV (+)	Minimum (%)	Median (%)	Maximum (%)	95% CI (%)		
Male STI patients	5.1%	0.7%	4.0%	16.7%	4.5% - 5.8%	4,607	237
FSW	11.4%	5.7%	11.4%	14.5%	9.3% - 13.4%	887	101
PWID	28.1%	7.9%	26.0%	39.4%	25.3% - 30.8%	1,029	289
MSM	11.0%	8.0%	11.0%	14.0%	7.9% - 14.1%	400	44
Pregnant Women	0.9%	0.0%	0.8%	3.3%	0.7% - 1.0%	13,703	122
New Military Recruits	1.0%	0.8%	1.0%	1.2%	0.3%- 1.7%	800	8
New TB patients	10.4%	0.7%	8.3%	27.9%	9.3% - 11.5%	2,863	298
Blood Donors	0.35%	0.00%	0.26%	0.86%	0.2% -0.5%	9,769	34
Total						34,058	1,133

Figure 22: The trends of HIV prevalence among different population 2006 - 2010

AIDS case reporting

In 2010 a total of 833 AIDS cases, including 37 paediatric AIDS cases, were reported from the hospitals all over the country. Out of them, 36.6% were females and 63.4% were males. Based on these reported cases, the transmission of HIV was attributed as follows: sexual transmission 66.9%, injecting drug use 4.6%, blood transfusion 2.4%, mother to child transmission 4.4%, and other causes 21.7%.

Figure 23: The trends of AIDS cases 1994 - 2010

HIV case reporting

A total of 2,144 HIV positive cases were reported during 2010. The male and female ratio was found to be 2.5:1. The highest mode (23.8%) of HIV positive cases was seen in 30-34 age group, closely followed by the 25-29 age group (19.9%) and 35-39 age group (18.8%).
